ABSTRACT
Siddha medicine is one of the oldest medical systems in the world. This system is most commonly practicing in India especially in southern regions. Siddha medicines become popular nowadays because of various outbreaks of communicable and very infectious diseases like chikungunya, dengue, swine flu etc. These diseases of viral origin are very challenge to the modern world because of lack of ideal anti-viral therapy. Pandemic flu is different from ordinary flu because it’s a new flu virus that appears in humans and spreads very quickly from person to person worldwide. Because it’s a new virus, no one will have immunity to it and everyone could be at risk of catching it. This includes healthy adults as well as older people, young children and those with existing medical conditions. The polyherbal decoction Kapa Sura Kudineer (KSK) is a well-known one in this series next to Nilavembu kudineer (NVK). This KSK is introduced for the prevention and the management of Swine flu. And the people of Tamil Nadu are very attentive about this Siddha drug KSK because to prevent and protect from the deadly life threatening disease, Swine flu. Here, an attempt has been made to review the explored ethno pharmacological activities of the ingredients of KSK to strengthen the scientific facts favoring this formulation.

Keywords: Herbal Medicine, Nilavembu, Indian system of Medicine, Kapa suram.

INTRODUCTION
The World health Organization (WHO) estimated that 80% of the populations of developing countries rely on traditional medicines, mostly plant drugs for their primary health care needs. [1] The most important of these biologically active constituents of plants are alkaloids, flavonoids, tannins and phenolic compounds. [2] Mortality rate in some of dreadful viral fevers like Dengue, Chikungunya and Swine flu have been increased which creates panic among the people. Many dreadful viral fevers have been reported recently in India and other Asian countries Swine flu is an emerging viral infection that is a present global public health problem. There are thousand cases of swine flu in the present day. Due to the nature of respiratory virus, the transmission of this pathogenic virus is air borne transmission. Hence, the rapid spreading and difficulty in control of this infection can be expected. [3]

Fig. 1: Photographs of the ingredients of Kapa Sura Kudineer (KSK)

In Siddha clinical practice Nilavembu Kudineer (NVK) a decoction based polyherbal Siddha formulation is prescribed for suram (fever) of unknown origin (PUO). It is used as first line therapy and general remedy for some types of fever caused by unidentified microbial infections. Like that “Kapa sura Kudineer” has taken the main role in the prevention of swine flu nowadays in a popular manner. The drug KSK has been quoted for kapasuram, the symptoms of which is an analogue with swine flu, mentioned in Siddha Formulary of India. The aim and objective of this article is to reveal the scientific records of the ingredients of “Kapa sura Kudineer” which may be helpful for scientist, researchers, and practitioners.

Swine flu (swine influenza)

It is a respiratory disease caused by viruses (influenza viruses) that infect the respiratory tract of pigs and result in nasal secretions, a barking-like cough, decreased appetite and listless behavior. [1]

Main symptoms of swine flu in humans [2]

Direct transmission of a swine flu virus from pigs to humans is occasionally possible (called zoonotic swine flu). In all, 50 cases are known to have occurred since the first report in medical literature in 1958, which have resulted in a total of six deaths. Of these six people, one was pregnant, one had leukemia, one had Hodgkin disease and two were known to be previously healthy. Despite these apparently low numbers of infections, the true rate of infection may be higher, since most cases only cause a very mild disease, and will probably never be reported or diagnosed. According to the Centers for Disease Control and Prevention (CDC), in humans the symptoms of the 2009 “swine flu” H1N1 virus are similar to those of influenza and of influenza-like illness in general.

Typical Symptoms [3]

Symptoms include fever, cough, sore throat, body aches, headache, chills and fatigue. The 2009 outbreak has shown an increased percentage of patients
reporting diarrhea and vomiting. The 2009 H1N1 virus is not zoonotic swine flu, as it is not transmitted from pigs to humans, but from person to person.

**Diagnosis**

For diagnosis of “swine influenza- A” infection, respiratory specimen (nasopharyngeal swab, throat swab nasal aspirate, nasal washing) would generally need to be collected within the first 4 to 5 days of illness (when an infected person is most likely to be shedding virus). [3]

Most of the tests can distinguish between A and B types. The test can be negative (no H1N1 infection) or positive for type A and B. If the test is positive for type B, the flu is not likely to be swine influenza (H1N1). If it is positive for type A, the person could have conventional influenza strain or swine influenza (H1N1). [7]

The U. S. Food and Drug Administration (FDA) approved the new swine flu vaccine for use in the United States on September 15, 2009. Studies by the National Institutes of Health (NIH) show that a single dose creates enough antibodies to protect against the virus within about 10 days. But unfortunately, this according to update reports in Reuters; eight hundred children in Europe have developed narcolepsy an incurable sleep disorder after taking the swine flu vaccine Pandemrix H1N1 vaccine which is made by GlaxoSmithKline.

Swine Flu and Siddha Medicine
Siddha system of Medicine explains about 4448 diseases in its text quoted by the saint Agasthiyar. All these diseases are caused due to alteration in three humors of body called Vatham, Pitham, and Kapham.
Siddha promotes the concept that if one's immune system (3 humors) is strong and normal then even if the body is exposed to any microorganism, one will not be affected. During a pandemic or an epidemic attacks, Siddha emphasizes on the resistance of people existing in regions affected by viruses. This medicine promotes the intake of decoctions to increase the immunity level of the people and to neutralize or normalize the 3 humors. Siddha remedies consist of natural herbs which are effective in preventing and controlling swine flu. Moreover, the herbs in the decoction or any other medications are used to relieve swine flu symptoms, and boost the immune system against the H1N1 virus and to relieve from the symptoms. On this way, Siddha treatment for swine flu involves the use of Kapa Sura Kudineer which comprising 15 drugs explained in Table I.

Ethno Pharmacological Aspects
The Phytoto chemical constituents and pharmacological actions of the ingredients, explained in the Table II & III, indicates that most of the herbs are having anti inflammatory, Antipyretic, Analgesic, anti viral, anti bacterial, anti fungal, anti oxidant, Hepato protective, anti diabetic, anti-asthmatic, Anti-tussive, Immunomodulatory, anti-diarrheal and Anti-oxidant activities.

In the developing countries increased cost of medicine as well as their side effects has become a great task when the public health is concerned. Investigations have been carried out from time to time to develop different types of polyherbal formulations to enhance the overall therapeutic potential of the formulation [40]. And so, nowadays the traditional medical system and their herbal / herbo-mineral preparations are for various ailments becoming more popular. A lot of research articles confirm that these herbs possess' effective anti-viral, anti-bacterial and commonly antimicrobial activity without causing any hepatic damage and renal damage to a certain extent like conventional drugs. When comparing with the ethno pharmacological aspects of these ingredients with Siddha literature strongly indicates that the KSK prepared out of these drugs can reveal Anti-viral, Anti allergic, Anti-asthmatic & antipyretic activity with Hepato- protective effect and serve as an excellent defensive as well as a healing one.

Based on this text survey the KSK can be used for preventative as well as curative for swine flu. In future more awareness must be given to the further research. This KSK formulation has not been studied for its synergistic pharmacological activities. It is the further need of time to complete pharmacological and clinical studies to protect people from the deadly disease swine flu.
